

How to setup the module test software ?

I tried to install the Lyon+Antwerpen software from scratch

<http://hep.uia.ac.be/cms/testing/software/ltswinstalistr.html>

<http://hep.uia.ac.be/cms/testing/software/modtestsoft.htm>

After several attempts to recompile the old version of the software on the new platform (RedHat 7.3) I discovered that

- **RedHat 7.3 is not good, because I need a kernel 2.2.x, so I need downgrade to RH-6.2 (RH-7.0 is possible, but non recommended)**
- **It is necessary to install gcc 2.9.5**
- **...**

How to setup the module test software ?

So, I realized that I am working in very inefficient way.
I understand, that DAQ software is under development.

But, my be now is a good moment to make **RELEASE?**

It could contain the **STATIC** version the software which mandatory for CMS (with minimum WWW links !) + some tools related to "OLD" system + present version of documentation.

Could we produce CD, or put all this stuff into some public place where it will not be changed?

But it should be installable, and the installation should be tested
